## 1 EXERCISE 1: THE PARTIAL TRACE

We saw in the lectures that given a multi-partite state, we obtain the state of a subsystem by applying the partial trace to the other systems.

1. Compute the trace of the following states by applying the trace formula  $Tr(A) = \sum_i \langle i| A |i\rangle$  from the lectures:

(a)  $\xi = \frac{1}{2}(|0\rangle\langle 0| - i|0\rangle\langle 1| + i|1\rangle\langle 0| + |1\rangle\langle 1|)$

(b)  $\Lambda = \frac{I}{3} + \frac{1}{6}(|0\rangle\langle 1| + |1\rangle\langle 0|)$  (here,  $I$  is the identity matrix).

Which of the states is normalized correctly? (\*) (4 points)

Answer:  $\xi = \frac{1}{2}(|0\rangle\langle 0| - i|0\rangle\langle 1| + i|1\rangle\langle 0| + |1\rangle\langle 1|)$

$$Tr(\xi) = \langle 0|\xi|0\rangle + \langle 1|\xi|1\rangle = \frac{1}{2}(\langle 0|0\rangle\langle 0|0\rangle - i\langle 0|1\rangle\langle 0|0\rangle + i\langle 0|1\rangle\langle 0|0\rangle + \langle 0|1\rangle\langle 1|0\rangle + \langle 1|0\rangle\langle 0|1\rangle - i\langle 1|0\rangle\langle 1|1\rangle + i\langle 1|1\rangle\langle 0|1\rangle + \langle 1|1\rangle\langle 1|1\rangle) = \frac{1}{2}(1 + 1) = 1$$

$$\Lambda = \frac{I}{3} + \frac{1}{6}(|0\rangle\langle 1| + |1\rangle\langle 0|) = \frac{1}{3}|0\rangle\langle 0| + \frac{1}{6}|0\rangle\langle 1| + \frac{1}{6}|1\rangle\langle 0| + \frac{1}{3}|1\rangle\langle 1|$$

$$\begin{aligned} Tr(\Lambda) &= \langle 0|\Lambda|0\rangle + \langle 1|\Lambda|1\rangle \\ &= \frac{1}{3}\langle 0|0\rangle\langle 0|0\rangle + \frac{1}{6}\langle 0|0\rangle\langle 1|0\rangle + \frac{1}{6}\langle 0|1\rangle\langle 0|0\rangle + \frac{1}{3}\langle 0|1\rangle\langle 1|0\rangle + \frac{1}{3}\langle 1|0\rangle\langle 0|1\rangle + \frac{1}{6}\langle 1|0\rangle\langle 1|1\rangle + \frac{1}{6}\langle 1|1\rangle\langle 0|1\rangle + \\ &\quad \frac{1}{3}\langle 1|1\rangle\langle 1|1\rangle \\ &= \frac{1}{3}(1 + 1) \\ &= \frac{2}{3} \end{aligned}$$

So  $\xi$  is normalized correctly.

2. In the last assignment we found the probability to find a state  $|\gamma\rangle$  in another state  $|\delta\rangle$  to be  $p = |\langle\gamma|\delta\rangle|^2$ . Show here that this expression coincides with  $Tr(\gamma\delta)$ , for  $\gamma = |\gamma\rangle\langle\gamma|$  and  $\delta = |\delta\rangle\langle\delta|$ . Hint: Apply the trace formula  $Tr(A) = \sum_i \langle i|A|i\rangle$  from the lectures. Use a suitable basis of your choice. (4 points)

$$\begin{aligned} \text{Answer: } Tr(\gamma\delta) &= Tr(|\gamma\rangle\langle\gamma||\delta\rangle\langle\delta|) \\ &= Tr(|\gamma\rangle\langle\gamma|\delta\rangle\langle\delta|) \\ &= Tr(\langle\gamma|\delta\rangle|\gamma\rangle\langle\delta|) \\ &= \langle\gamma|\delta\rangle Tr(|\gamma\rangle\langle\delta|) \\ &= \langle\gamma|\delta\rangle \sum_i \langle i|\gamma\rangle\langle\delta|i\rangle \\ &= \langle\gamma|\delta\rangle (\langle 0|\gamma\rangle\langle\delta|0\rangle + \langle 1|\gamma\rangle\langle\delta|1\rangle) \\ &= \langle\gamma|\delta\rangle (\langle 0|\gamma\rangle\langle\delta|0\rangle + \langle 1|\gamma\rangle\langle\delta|1\rangle) \\ &= \langle\gamma|\delta\rangle (\langle\gamma|0\rangle\langle 0|\delta\rangle + \langle\gamma|1\rangle\langle 1|\delta\rangle) \\ &= \langle\gamma|\delta\rangle (\langle\gamma|\delta\rangle) \\ &= |\langle\gamma|\delta\rangle|^2 \end{aligned}$$

$$\text{So, } Tr(\gamma\delta) = |\langle\gamma|\delta\rangle|^2 = p.$$

3. Consider the bipartite state  $|\phi\rangle_{AB} = \frac{1}{\sqrt{3}}(|00\rangle_{AB} + i|01\rangle_{AB} - |11\rangle_{AB})$ . Write the density operator  $\rho_{AB} = |\phi\rangle_{AB}\langle\phi|_{AB}$  explicitly in matrix form. (\*) (4 points)

Answer:  $\phi_{AB} = \frac{1}{\sqrt{3}}(|00\rangle_{AB} + i|01\rangle_{AB} - |11\rangle_{AB})$

$$= \frac{1}{\sqrt{3}} \left( \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} + i \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} - \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix} \right)$$

$$= \frac{1}{\sqrt{3}} \begin{bmatrix} 1 \\ i \\ 0 \\ -1 \end{bmatrix}$$

$$\rho_{AB} = |\phi\rangle_{AB} \langle\phi|_{AB}$$

$$= \frac{1}{3} \begin{bmatrix} 1 \\ i \\ 0 \\ -1 \end{bmatrix} [1 \quad -i \quad 0 \quad -1]$$

$$= \frac{1}{3} \begin{bmatrix} 1 & -i & 0 & -1 \\ i & 1 & 0 & -i \\ 0 & 0 & 0 & 0 \\ -1 & -i & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} \frac{1}{3} & -\frac{i}{3} & 0 & -\frac{1}{3} \\ \frac{i}{3} & \frac{1}{3} & 0 & -\frac{i}{3} \\ 0 & 0 & 0 & 0 \\ -\frac{1}{3} & \frac{i}{3} & 0 & \frac{1}{3} \end{bmatrix}$$

4. Let  $\sigma_{AB}$  be a general 2-qubit state. The  $4 \times 4$  matrix describing  $\sigma_{AB}$  can be split into four sub-matrices of size  $2 \times 2$  (upper left block, upper right block, lower left block, lower right block). Show that the reduced single qubit state  $\sigma_B = \text{Tr}_A(\sigma_{AB})$  is described by a  $2 \times 2$  matrix that is the sum of the upper left block and lower right block matrices of  $\sigma_{AB}$ . Hint: start from  $\sigma_{AB} = \sigma_{00}|00\rangle\langle 00| + \sigma_{01}|00\rangle\langle 01| + \dots + \sigma_{33}|11\rangle\langle 11|$  and compute the partial trace in bra-ket notation. Write  $\sigma_{AB}$  as a matrix and compare. (8 points)

Answer:  $\sigma_{AB} = \sigma_{00}|00\rangle\langle 00| + \sigma_{01}|00\rangle\langle 01| + \dots + \sigma_{33}|11\rangle\langle 11|$

$$\sigma_B =$$

$$= \text{Tr}_A(\sigma_{AB})$$

$$= \sum_i \langle i|_A \sigma_{AB} |i\rangle_A$$

$$= \langle 0|_A \sigma_{AB} |0\rangle_A + \langle 1|_A \sigma_{AB} |1\rangle_A$$

$$= \langle 0|_A (\sigma_{00}|00\rangle_{AB} \langle 00| + \sigma_{01}|00\rangle_{AB} \langle 01|_{AB} + \dots + \sigma_{33}|11\rangle_{AB} \langle 11|_{AB}) |0\rangle + \langle 1| (\sigma_{00}|00\rangle_{AB} \langle 00|_{AB} + \sigma_{01}|00\rangle_{AB} \langle 01|_{AB} + \dots + \sigma_{33}|11\rangle_{AB} \langle 11|_{AB}) |1\rangle_A$$

$$= \sigma_{00}|0\rangle\langle 0| + \sigma_{01}|0\rangle\langle 1| + \sigma_{10}|1\rangle\langle 0| + \sigma_{11}|1\rangle\langle 1| + \sigma_{22}|0\rangle\langle 0| + \sigma_{23}|0\rangle\langle 1| + \sigma_{32}|1\rangle\langle 0| + \sigma_{33}|1\rangle\langle 1|$$

$$= (\sigma_{00} + \sigma_{22})|0\rangle\langle 0| + (\sigma_{01} + \sigma_{23})|0\rangle\langle 1| + (\sigma_{10} + \sigma_{32})|1\rangle\langle 0| + (\sigma_{12} + \sigma_{33})|1\rangle\langle 1|$$

This is the sum of the upper left block and lower right block matrices of  $\sigma_{AB}$ .

5. Take the state  $\rho_{AB}$  from 3. and compute the reduced state  $\rho_B$ , both from the matrix itself (using your result from 4.) and in bra-ket notation. (\*) (6 points)

Answer:  $\begin{bmatrix} \frac{1}{3} & -\frac{i}{3} & 0 & -\frac{1}{3} \\ \frac{i}{3} & \frac{1}{3} & 0 & -\frac{i}{3} \\ 0 & 0 & 0 & 0 \\ -\frac{1}{3} & \frac{i}{3} & 0 & \frac{1}{3} \end{bmatrix}$

$$\rho_B = (\sigma_{00} + \sigma_{22})|0\rangle\langle 0| + (\sigma_{01} + \sigma_{23})|0\rangle\langle 1| + (\sigma_{10} + \sigma_{32})|1\rangle\langle 0| + (\sigma_{12} + \sigma_{33})|1\rangle\langle 1|$$

$$= \frac{1}{3}|0\rangle\langle 0| - \frac{i}{3}|0\rangle\langle 1| + \frac{i}{3}|1\rangle\langle 0| + 0|1\rangle\langle 1|$$

$$= \begin{bmatrix} \frac{1}{3} & -\frac{i}{3} \\ \frac{i}{3} & \frac{1}{3} \end{bmatrix}$$

## 2 EXERCISE 2: MEASUREMENTS AND REDUCED STATES

Let us look at the density operator  $\rho_{AB} = |\Phi^-\rangle\langle\Phi^-|$ , with  $|\Phi^-\rangle = \frac{1}{\sqrt{2}}(|01\rangle - |10\rangle)$ .

1. Compute explicitly the post-measurement state after we performed a projective measurement  $M = \{|0\rangle\langle 0|, |1\rangle\langle 1|\}$  on  $\rho_{AB}$  on system  $B$ , given that the outcome was 0. Compute the same for the measurement  $M = \{|+\rangle\langle +|, |-\rangle\langle -|\}$ , for outcome  $-$ . (Hint: Using Exercise 2.6 from Assignment 1 might help (not necessary though).) (8 points)

Answer:  $M_0 = |0\rangle\langle 0|$

Observe  $|0\rangle$  with probability  $p_0 = \text{Tr}(M_0\rho) = \text{Tr}(I \otimes |0\rangle\langle 0| \rho) = \text{Tr}(I \otimes |0\rangle\langle 0| |\Phi^-\rangle\langle\Phi^-|) = \text{Tr}(I \otimes |0\rangle\langle 0| \frac{1}{2}(|01\rangle\langle 10| - |01\rangle\langle 01| - |10\rangle\langle 10| + |10\rangle\langle 01|)) = \text{Tr}(\frac{1}{2}(-|10\rangle\langle 10| + |10\rangle\langle 01|)) = -\frac{1}{2}$

$$\begin{aligned}\rho'_0 &= \frac{M_0\rho M_0^\dagger}{\text{Tr}(M_0\rho)} \\ &= \frac{I \otimes |0\rangle\langle 0| |\Phi^-\rangle\langle\Phi^-| I \otimes |0\rangle\langle 0|}{\text{Tr}(\frac{1}{2}(-|10\rangle\langle 10| + |10\rangle\langle 01|))} \\ &= \frac{\frac{1}{2}(-|10\rangle\langle 10| + |10\rangle\langle 01|) I \otimes |0\rangle\langle 0|}{-\frac{1}{2}} \\ &= |10\rangle\langle 10|\end{aligned}$$

For system B,  $\rho'_{0B} = |0\rangle\langle 0|$

$M_1 = |-\rangle\langle -|$

Observe  $|-\rangle$  with probability  $p_1 = \text{Tr}(M_1\rho) = \text{Tr}(I \otimes |-\rangle\langle -| \rho) = \text{Tr}(I \otimes |-\rangle\langle -| |\Phi^-\rangle\langle\Phi^-|) = \text{Tr}(I \otimes |-\rangle\langle -| \frac{1}{2}(|+\rangle\langle +| - |+\rangle\langle -| - |-\rangle\langle +| + |-\rangle\langle -|)) = \frac{1}{2}\text{Tr}(|+\rangle\langle +| - |+\rangle\langle -| - |-\rangle\langle +| + |-\rangle\langle -|) = -\frac{1}{2}$

$$\begin{aligned}\rho'_1 &= \frac{M_1\rho M_1^\dagger}{\text{Tr}(M_1\rho)} \\ &= \frac{(|+\rangle\langle +| - |+\rangle\langle -| - |-\rangle\langle +| + |-\rangle\langle -|) I \otimes |-\rangle\langle -|}{\langle +| \otimes I |\Phi^-\rangle\langle\Phi^-| \otimes I} \\ &= |+-\rangle\langle +-| \\ &= |+\rangle\langle -| \otimes |+\rangle\langle -|\end{aligned}$$

For system B,  $\rho'_{1B} = |-\rangle\langle -|$

2. What is the post measurement state if the measurements above were destructive and yielded the same outcomes as in part 1.? (2 points)

Answer:

For the outcome 0,  $\rho''_0 = \frac{M_0\rho'_0 M_0^\dagger}{\text{Tr}(M_0\rho'_0)} = \frac{M_0|10\rangle\langle 10| M_0^\dagger}{\text{Tr}(M_0|10\rangle\langle 10|)} = \frac{I \otimes |0\rangle\langle 0| |10\rangle\langle 10| I \otimes |0\rangle\langle 0|}{\text{Tr}(I \otimes |0\rangle\langle 0| |10\rangle\langle 10|)} = |10\rangle\langle 10|$

For the outcome -,  $\rho''_- = \frac{M_1\rho'_1 M_1^\dagger}{\text{Tr}(M_1\rho'_1)} = \frac{M_1|+-\rangle\langle +-| M_1^\dagger}{\text{Tr}(M_1|+-\rangle\langle +-|)} = \frac{I \otimes |-\rangle\langle -| |+-\rangle\langle +-| I \otimes |-\rangle\langle -|}{\text{Tr}(I \otimes |-\rangle\langle -| |+-\rangle\langle +-|)} = |+-\rangle\langle +-|$

3. What is the reduced state  $\rho_A$  if we take state  $\rho_{AB}$  and trace over system B in basis  $\{|0\rangle, |1\rangle\}$ ? What if we trace in  $\{|+\rangle, |-\rangle\}$ ? Hint: for the second computation it could be useful to use the basis invariance of the trace operation. (6 points)

Answer:  $\rho_{AB} = |\Phi^-\rangle\langle\Phi^-| = \frac{1}{2}(|01\rangle - |10\rangle)(\langle 10| - \langle 01|) = \frac{1}{2}(|01\rangle\langle 10| - |01\rangle\langle 01| - |10\rangle\langle 10| + |10\rangle\langle 01|)$

$\rho_A = \text{Tr}_B(\rho_{AB}) = \langle 0|_B \rho_{AB} |0\rangle_B + \langle 1|_B \rho_{AB} |1\rangle_B = -\frac{1}{2}|0\rangle\langle 0| - \frac{1}{2}|1\rangle\langle 1|$

In the basis  $\{|+\rangle, |-\rangle\}$ ,  $\Phi = \frac{1}{2}(|+\rangle \otimes |-\rangle - |-\rangle \otimes |+\rangle)$

$$\begin{aligned}\rho_A &= \text{Tr}_B(\rho_{AB}) = \langle +|_B \rho_{AB} |+\rangle_B + \langle -|_B \rho_{AB} |-\rangle_B \\ &= \frac{1}{2}((\langle 0|_B + \langle 1|_B) \rho_{AB} (|0\rangle_B + |1\rangle_B)) + \frac{1}{2}((\langle 0|_B - \langle 1|_B) \rho_{AB} (|0\rangle_B - |1\rangle_B)) \\ &= \frac{1}{2}(\langle 0|_B \rho_{AB} |0\rangle_B + \langle 0|_B \rho_{AB} |1\rangle_B + \langle 1|_B \rho_{AB} |0\rangle_B + \langle 1|_B \rho_{AB} |1\rangle_B + \langle 0|_B \rho_{AB} |0\rangle_B - \langle 0|_B \rho_{AB} |1\rangle_B - \langle 1|_B \rho_{AB} |0\rangle_B + \langle 1|_B \rho_{AB} |1\rangle_B) \\ &= \frac{1}{2}(2\langle 0|_B \rho_{AB} |0\rangle_B + 2\langle 1|_B \rho_{AB} |1\rangle_B) \\ &= \langle 0|_B \rho_{AB} |0\rangle_B + \langle 1|_B \rho_{AB} |1\rangle_B \\ &= -\frac{1}{2}|0\rangle\langle 0| - \frac{1}{2}|1\rangle\langle 1|\end{aligned}$$

4. Consider now the  $2n$ -qubit state  $\rho = |\Psi_n\rangle\langle\Psi_n|$ , with  $|\Psi_n\rangle = \frac{1}{\sqrt{2^n}} \sum_i |i\rangle_A \otimes |i\rangle_B$ . What is the reduced  $n$ -qubit state on Alice's side? (Hint: look at the state in vector form and factorize it in a smart way.) (8 points)

$$\begin{aligned}\text{Answer: } \rho &= \frac{1}{2^n} \sum_i |i\rangle_A \otimes |i\rangle_B \langle i|_A \langle i|_B \\ &= \frac{1}{2^n} \sum_i |i\rangle_A \otimes |i\rangle_B \langle i|_A \otimes \langle i|_B \\ \text{Tr}_B(\rho) &= \frac{1}{2^n} \sum_k \sum_i \langle k|_B \langle i|_B \otimes |i\rangle_B \langle i|_B |k\rangle_B \\ &\text{If } i \neq k, \langle k|_B |i\rangle_B = 0 \\ \text{Tr}_B(\rho) &= \frac{1}{2^n} \sum_i \langle i|_B |i\rangle_B \otimes |i\rangle_A \langle i|_A \\ &= \frac{1}{2^n} \sum_i |i\rangle_A \langle i|_A \\ &= \frac{I_n}{2^n}\end{aligned}$$

5. What is the reduced state on the first  $k$  qubits of A and B (i.e. tracing out the last  $n - k$  qubits on each side)? (4 points)

$$\begin{aligned}\text{Answer: } \rho_{0 \rightarrow k-1} &= \text{Tr}_{\rho_{k \rightarrow n-1}}(\rho_{AB}) = \sum_{m=k}^{n-1} \langle m|_B |\Psi_n\rangle\langle\Psi_n| |m\rangle_B \\ &= \frac{1}{2^n} \sum_{m=k}^{n-1} \sum_i \langle m|_B |i\rangle_B \otimes |i\rangle_A \langle i|_A \otimes \langle i|_B |m\rangle_B \\ &\text{if } m \neq i, \langle m|_B |i\rangle_B = 0. \\ \text{So, } \rho_{0 \rightarrow k} &= \frac{1}{2^n} \sum_{i=k}^{n-1} |i\rangle_A \langle i|_A = \frac{I_{n-k-1}}{2^n}\end{aligned}$$

### 3 EXERCISE 3: EVOLUTIONS AND KRAUS OPERATORS

1. Consider the following channel  $C$ . It maps the classical state  $|0\rangle$  to the state  $|0\rangle$  with probability  $(1-p)$  and to  $|1\rangle$  with probability  $p$ . Symmetrically, the state  $|1\rangle$  is mapped to the state  $|1\rangle$  with probability  $(1-p)$  and to  $|0\rangle$  with probability  $p$ . Find a Kraus operator representation of the channel and show that your choice is valid, and that it maps the classical states  $|0\rangle$  and  $|1\rangle$  correctly. (4 points)

$$\text{Answer: } \{E_0, E_1, E_2, E_3\} = \{\sqrt{1-p}|0\rangle\langle 0|, \sqrt{p}|0\rangle\langle 1|, \sqrt{p}|1\rangle\langle 0|, \sqrt{1-p}|1\rangle\langle 1|\}$$

$$\begin{aligned}\sum_i E_i^\dagger E_i &= (1-p)|0\rangle\langle 0| + p|1\rangle\langle 0| + p|0\rangle\langle 1| + (1-p)|1\rangle\langle 1| \\ &= |0\rangle\langle 0| + |1\rangle\langle 1| = I\end{aligned}$$

$$C(\rho) = \sum_i E_i \rho E_i^\dagger$$

$$\begin{aligned}C(|0\rangle\langle 0|) &= (1-p)|0\rangle\langle 0| + p|1\rangle\langle 0| \\ &= (1-p)|0\rangle\langle 0| + p|1\rangle\langle 1|\end{aligned}$$

$$\begin{aligned}C(|1\rangle\langle 1|) &= (1-p)|0\rangle\langle 1| + p|1\rangle\langle 1| \\ &= p|0\rangle\langle 0| + (1-p)|1\rangle\langle 1|\end{aligned}$$

$$\text{Assume a coherent state } \rho = \frac{1}{2}(|0\rangle\langle 0| + |0\rangle\langle 1| + |1\rangle\langle 0| + |1\rangle\langle 1|)$$

$$C(\rho) = \sum_i E_i \rho E_i^\dagger = \frac{1}{2}((1-p)|0\rangle\langle 0| + p|0\rangle\langle 0| + p|1\rangle\langle 1| + (1-p)|1\rangle\langle 1|) = \frac{1}{2}(|0\rangle\langle 0| + |1\rangle\langle 1|)$$

So, this Kraus operator representation of the channel is valid, and it maps the classical states  $|0\rangle$  and  $|1\rangle$  correctly.

2. Apply the classical channel  $C$  to a general quantum state  $\rho = \sum_{i,j} \alpha_{i,j} |i\rangle\langle j|$  (using the Kraus operators found above) and demonstrate that the off-diagonal terms vanish.

$$\begin{aligned}C(\rho) &= \sum_k E_k \rho E_k^\dagger \\ &= \sum_k E_k \sum_{i,j} \alpha_{i,j} |i\rangle\langle j| E_k^\dagger \\ &= (1-p)|0\rangle\langle 0| \sum_{i,j} \alpha_{i,j} |i\rangle\langle j| + p|1\rangle\langle 0| \sum_{i,j} \alpha_{i,j} |i\rangle\langle j| + p|0\rangle\langle 1| \sum_{i,j} \alpha_{i,j} |i\rangle\langle j| + (1-p)|1\rangle\langle 1| \sum_{i,j} \alpha_{i,j} |i\rangle\langle j|\end{aligned}$$

$$\text{If } i \neq k \text{ or } j \neq k, \langle k|_B |i\rangle_B \langle j|_B |k\rangle_B = 0$$

$$\begin{aligned}C(\rho) &= (1-p)\alpha_{00}|0\rangle\langle 0| + p\alpha_{11}|1\rangle\langle 1| + (1-p)\alpha_{11}|1\rangle\langle 1| \\ &= [(1-p)\alpha_{00} + p\alpha_{11}]|0\rangle\langle 0| + [(1-p)\alpha_{11} + p\alpha_{00}]|1\rangle\langle 1|\end{aligned}$$

This equation shows that the off-diagonal terms vanish.

3. Can you think of a quantum version of the channel, which operates correctly on the coherent (off-diagonal) terms of  $\rho$ ? Write it down and show that it is valid and correct. Hint: apply the new set of Kraus operators first to the classical states  $|0\rangle$  and  $|1\rangle$  to check correctness. Then, apply it to  $\rho$  and show that it preserves coherence. (8 points)

$$\text{Answer: } \{E_0, E_1\} = \{\sqrt{p}|0\rangle\langle 0| + \sqrt{p}|1\rangle\langle 1|, \sqrt{1-p}|0\rangle\langle 1| + \sqrt{1-p}|1\rangle\langle 0|\}$$

$$\sum_i E_i^\dagger E_i = (1-p)|0\rangle\langle 0| + (1-p)|1\rangle\langle 1| + p|0\rangle\langle 0| + p|1\rangle\langle 1| = I$$

$$C(|0\rangle\langle 0|) = E_0|0\rangle\langle 0|E_0^\dagger + E_1|0\rangle\langle 0|E_1^\dagger = p|1\rangle\langle 1| + (1-p)|0\rangle\langle 0|$$

$$C(|1\rangle\langle 1|) = E_0|1\rangle\langle 1|E_0^\dagger + E_1|1\rangle\langle 1|E_1^\dagger = p|0\rangle\langle 0| + (1-p)|1\rangle\langle 1|$$

For a classical state the off-diagonal terms vanish.

$$\text{For a coherent state } \rho = \alpha_{00}|0\rangle\langle 0| + \alpha_{01}|0\rangle\langle 1| + \alpha_{10}|1\rangle\langle 0| + \alpha_{11}|1\rangle\langle 1|$$

$$C(\rho) = \sum_i E_i \rho E_i^\dagger = p\alpha_{00}|0\rangle\langle 0| + p\alpha_{01}|1\rangle\langle 1| + (1-p)\alpha_{10}|0\rangle\langle 1| + (1-p)\alpha_{01}|1\rangle\langle 0|$$

For a quantum state, the off-diagonal terms do not vanish.

So, this channel is valid and correct and it operates correctly on the coherent (off-diagonal) terms of  $\rho$ .

## 4 EXERCISE 4: THE GATE MODEL

Consider the following circuit diagram:

The initial states are the two qubits  $|+\rangle$  and  $|-\rangle$ . The upper wire is initialized in state  $|+\rangle$  and experiences a controlled X gate. The lower wire is initialized in state  $|-\rangle$ , then first transformed by the Hadamard gate, and afterwards acts as a control state for the controlled X gate. Finally, a measurement  $M$  measures each qubit in the computational basis.

1. What is the state of the system before the measurement  $M$ ? (4 points)

$$\begin{aligned} \text{Answer: } H(|-\rangle) &= \left(\frac{1}{\sqrt{2}}|0\rangle\langle 0| + \frac{1}{\sqrt{2}}|0\rangle\langle 1| + \frac{1}{\sqrt{2}}|1\rangle\langle 0| - \frac{1}{\sqrt{2}}|1\rangle\langle 1|\right)|-\rangle \\ &= \frac{1}{2}(|0\rangle + |1\rangle - |0\rangle + |1\rangle) \\ &= |1\rangle \end{aligned}$$

So the output of gate  $H$  is  $|1\rangle$ , which means gate  $X$  will be applied to the upper wire.

$$\begin{aligned} X(|+\rangle) &= (|0\rangle\langle 1| + |1\rangle\langle 0|)|+\rangle \\ &= (|0\rangle\langle 1| + |1\rangle\langle 0|)\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle) \\ &= \frac{1}{\sqrt{2}}(|0\rangle + |1\rangle) \end{aligned}$$

So the state before measurement is  $|+\rangle \otimes |1\rangle$ .

2. Which are the possible measurement outcomes of  $M$  and what are their probabilities? (4 points)

Answer: The possible measurement outcomes of  $M$  are  $|01\rangle$  and  $|11\rangle$ .

$$P(|01\rangle) = \left|\frac{1}{\sqrt{2}}\langle 10|(|01\rangle + |11\rangle)\right|^2 = \frac{1}{2}$$

$$P(|11\rangle) = \left|\frac{1}{\sqrt{2}}\langle 11|(|01\rangle + |11\rangle)\right|^2 = \frac{1}{2}$$

The probability of  $|01\rangle$  is  $\frac{1}{2}$  and the probability of  $|11\rangle$  is  $\frac{1}{2}$ .

In the lectures we saw the controlled  $Z$  and controlled  $X$  gate, where  $Z = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$  and  $X = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$ .

3. Are the following two circuits the same? How about when we replace  $Z$  with  $X$ ? (6 points)

Answer: Assume the input of the upper wire is  $|\psi\rangle_A$  and the input of the lower wire is  $|\psi\rangle_B$ .

When  $|\psi\rangle_A = 0$ ,  $|\psi\rangle_B = 0$ , for the first circuit, the upper output is  $|0\rangle$ , and  $Z$  gate is not activated, the lower output is  $|0\rangle$ . For the second circuit, the output of lower wire is  $|0\rangle$ , the  $Z$  gate is not activated, the output of upper wire is  $|0\rangle$ .

When  $|\psi\rangle_A = 0$ ,  $|\psi\rangle_B = 1$ , for the first circuit, the upper output is  $|0\rangle$ , and Z gate is not activated, the lower output is  $|1\rangle$ . For the second circuit, the output of lower wire is  $|1\rangle$ , the Z gate is activated, the output of upper wire is  $(|0\rangle\langle 0| - |1\rangle\langle 1|)|0\rangle = |0\rangle$ .

When  $|\psi\rangle_A = 1$ ,  $|\psi\rangle_B = 0$ , for the first circuit, the upper output is  $|1\rangle$ , and Z gate is activated, the lower output is  $(|0\rangle\langle 0| - |1\rangle\langle 1|)|0\rangle = |0\rangle$ . For the second circuit, the output of lower wire is  $|0\rangle$ , the Z gate is activated, the output of upper wire is  $(|0\rangle\langle 0| - |1\rangle\langle 1|)|1\rangle = -|1\rangle$ .

When  $|\psi\rangle_A = 1$ ,  $|\psi\rangle_B = 1$ , for the first circuit, the upper output is  $|1\rangle$ , and Z gate is activated, the lower output is  $(|0\rangle\langle 0| - |1\rangle\langle 1|)|1\rangle = |1\rangle$ . For the second circuit, the output of lower wire is  $|1\rangle$ , the Z gate is activated, the output of upper wire is  $(|0\rangle\langle 0| - |1\rangle\langle 1|)|1\rangle = -|1\rangle$ .

So for gate Z, the two circuits are not the same.

If we replace Z with X, the two circuits are not the same. When  $|\psi\rangle_A = 0$ ,  $|\psi\rangle_B = 0$ , the output of the upper wire of the first circuit is  $|0\rangle$  and the output of the lower wire is  $|0\rangle$ . The output of the upper wire of the second circuit is  $|0\rangle$  and the output of the lower wire is  $|0\rangle$ . When  $|\psi\rangle_A = 0$ ,  $|\psi\rangle_B = 1$ , the output of the upper wire of the first circuit is  $|0\rangle$  and the output of the lower wire is  $|1\rangle$ . The output of the upper wire of the second circuit is  $|0\rangle$  and the output of the lower wire is  $|1\rangle$ . When  $|\psi\rangle_A = 1$ ,  $|\psi\rangle_B = 0$ , the output of the upper wire of the first circuit is  $|1\rangle$  and the output of the lower wire is  $|1\rangle$ . The output of the upper wire of the second circuit is  $|0\rangle$  and the output of the lower wire is  $|1\rangle$ . When  $|\psi\rangle_A = 1$ ,  $|\psi\rangle_B = 1$ , the output of the upper wire of the first circuit is  $|1\rangle$  and the output of the lower wire is  $|0\rangle$ . The output of the upper wire of the second circuit is  $|0\rangle$  and the output of the lower wire is  $|1\rangle$ .

So for gate X, the two circuits are not the same.

4. The SWAP gate acts on a quantum state  $|i\rangle \otimes |j\rangle$  as  $\text{SWAP } |ij\rangle = |ji\rangle$ . Show that the following circuit implements the SWAP gate (the symbol L is often used in the literature for the X gate). (8 points)

Answer: Assume the input of the upper wire is  $|\psi\rangle_A$  and the input of the lower wire is  $|\psi\rangle_B$ .

When  $|\psi\rangle_A = 0$ ,  $|\psi\rangle_B = 0$ , the output of the upper wire is  $|0\rangle$  and the output of the lower wire is  $|0\rangle$ .

When  $|\psi\rangle_A = 0$ ,  $|\psi\rangle_B = 1$ , the output of the upper wire is  $|1\rangle$  and the output of the lower wire is  $|0\rangle$ .

When  $|\psi\rangle_A = 1$ ,  $|\psi\rangle_B = 0$ , the output of the upper wire is  $|0\rangle$  and the output of the lower wire is  $|1\rangle$ .

When  $|\psi\rangle_A = 1$ ,  $|\psi\rangle_B = 1$ , the output of the upper wire is  $|1\rangle$  and the output of the lower wire is  $|1\rangle$ .

5. Construct a controlled X gate by using Hadamard gates and controlled Z gates (you can use either as often as you like). Draw your circuit diagram. (6 points)

Answer: the picture is shown as figure 1.

$$\begin{aligned}
 & \text{I designed the circuit because for input } \rho, H(Z(H(\rho))) = \frac{1}{2} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \\
 &= \frac{1}{2} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \\
 &= \frac{1}{2} \begin{bmatrix} 0 & 2 \\ 2 & 0 \end{bmatrix} \\
 &= \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \\
 &= X
 \end{aligned}$$

and the upper wire controls the gates.
